The UNECE LRTAP Convention

- 1979: “Geneva Convention” on long-range trans-boundary air pollution signed by 32 states
- Goal: To reduce and prevent trans-boundary air pollution
- 1998: “Aarhus Protocol” on Persistent Organic Pollutants (POPs) adopted
 - Targets 16 substances
 - 11 pesticides, 2 industrial chemicals, 3 by-products

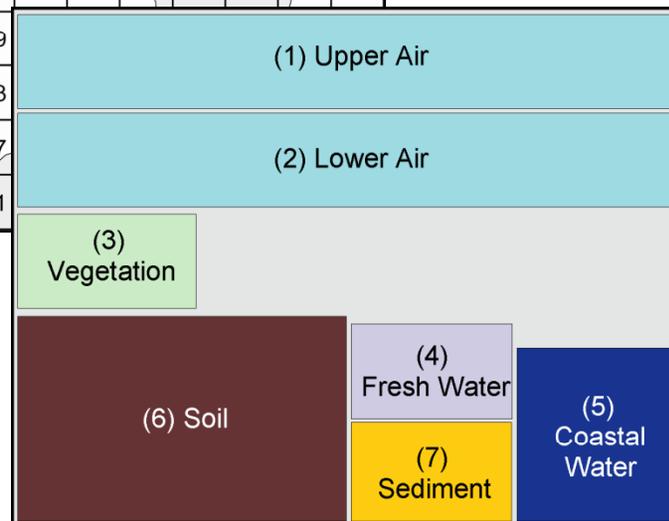

The TF HTAP

- A scientific task force established by the Executive Body of the CLRTAP
- Goals:
 - Improve understanding of hemispheric transport of air pollution
 - Estimate the extent of hemispheric transport of air pollutants for use in reviews of the convention protocols

BETR-Global: A fugacity-based mass balance contaminant fate model

BETR-Global

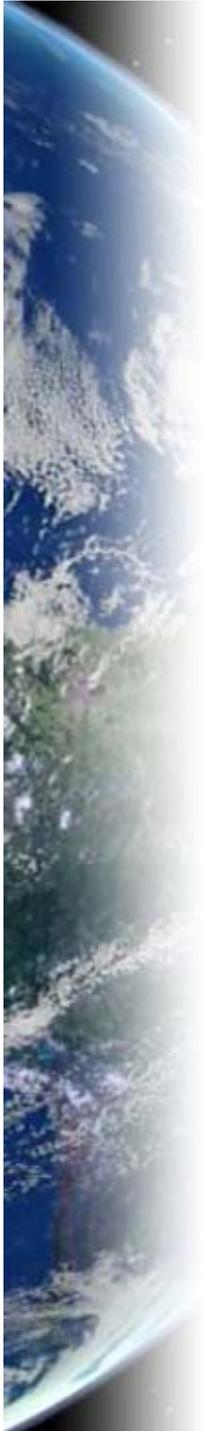

BETR-Global: Environmental Parameterization

- Prescribed atmospheric and ocean circulation data obtained from general circulation models
 - Monthly temporal resolution
- Environmental database includes:
 - windfields, precipitation amount and frequency, temperature, leaf area index, soil organic carbon, ocean particle sinking flux, OH radical concentrations

BETR-Global: Applications

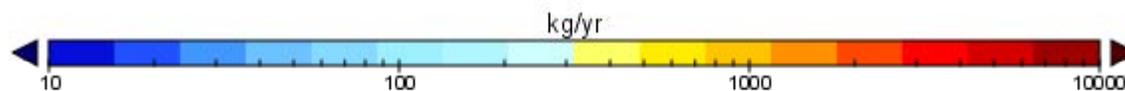

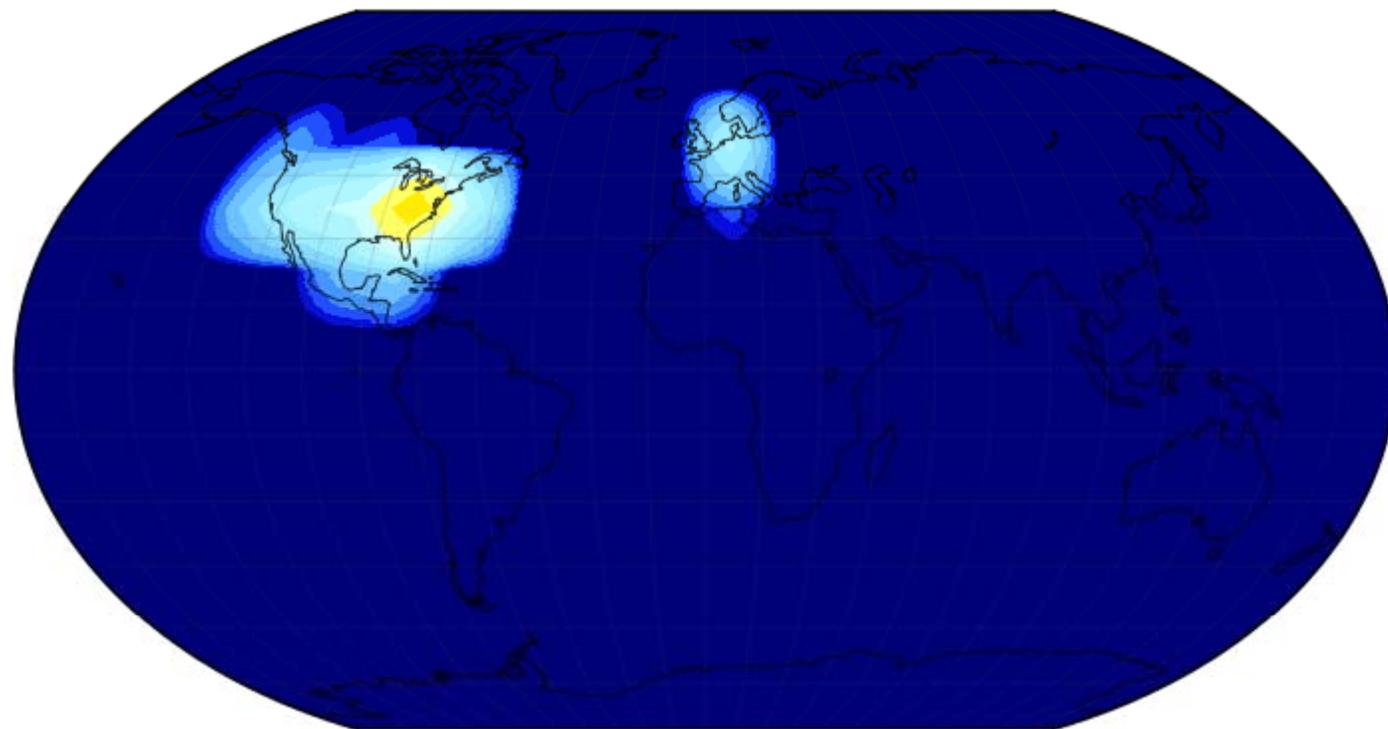

- Simulative
 - Evaluate our knowledge of sources, fate & transport and sinks against monitoring data
 - Build confidence that the model is a useful abstraction of the real system
- Scenario analysis
 - Evaluate alternative management actions or environmental scenarios

BETR-Global: Simulative Application to PCB 153

HTAP Emission Reduction Scenario Analysis

HTAP Emission Reduction Scenario Analysis

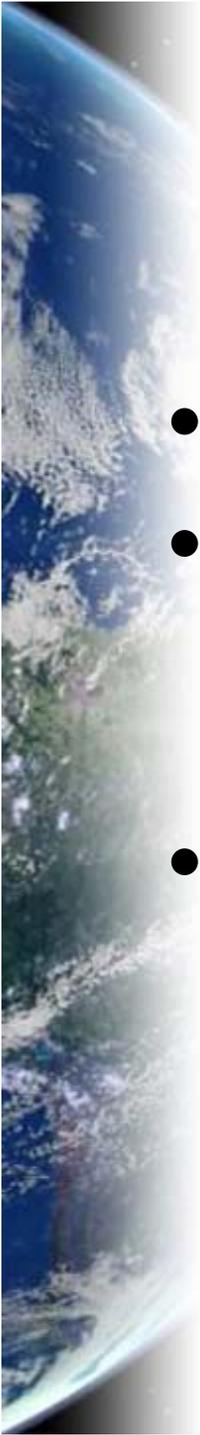

Emission Reduction Scenario Analysis: Model Comparison

Summary

- Simulative application of BETR Global provides a satisfactory quantitative description of PCB 153 and α -HCH in the global environment compared to observations
- HTAP Source-to-receptor calculations have been completed and show good agreement between models

Ongoing work...

- Further refinement of α -HCH case study
- Scenario analysis for climate change
 - With Lara Lamon, University Ca' Foscari, Venice, Santa Marta, Italy
- Mass balance modeling of manufacturing emissions of perfluorinated acids
 - James Armitage & Ian Cousins, ITM Stockholm, Sweden

Evaluation of Changes in global fate and transport under a climate change scenario

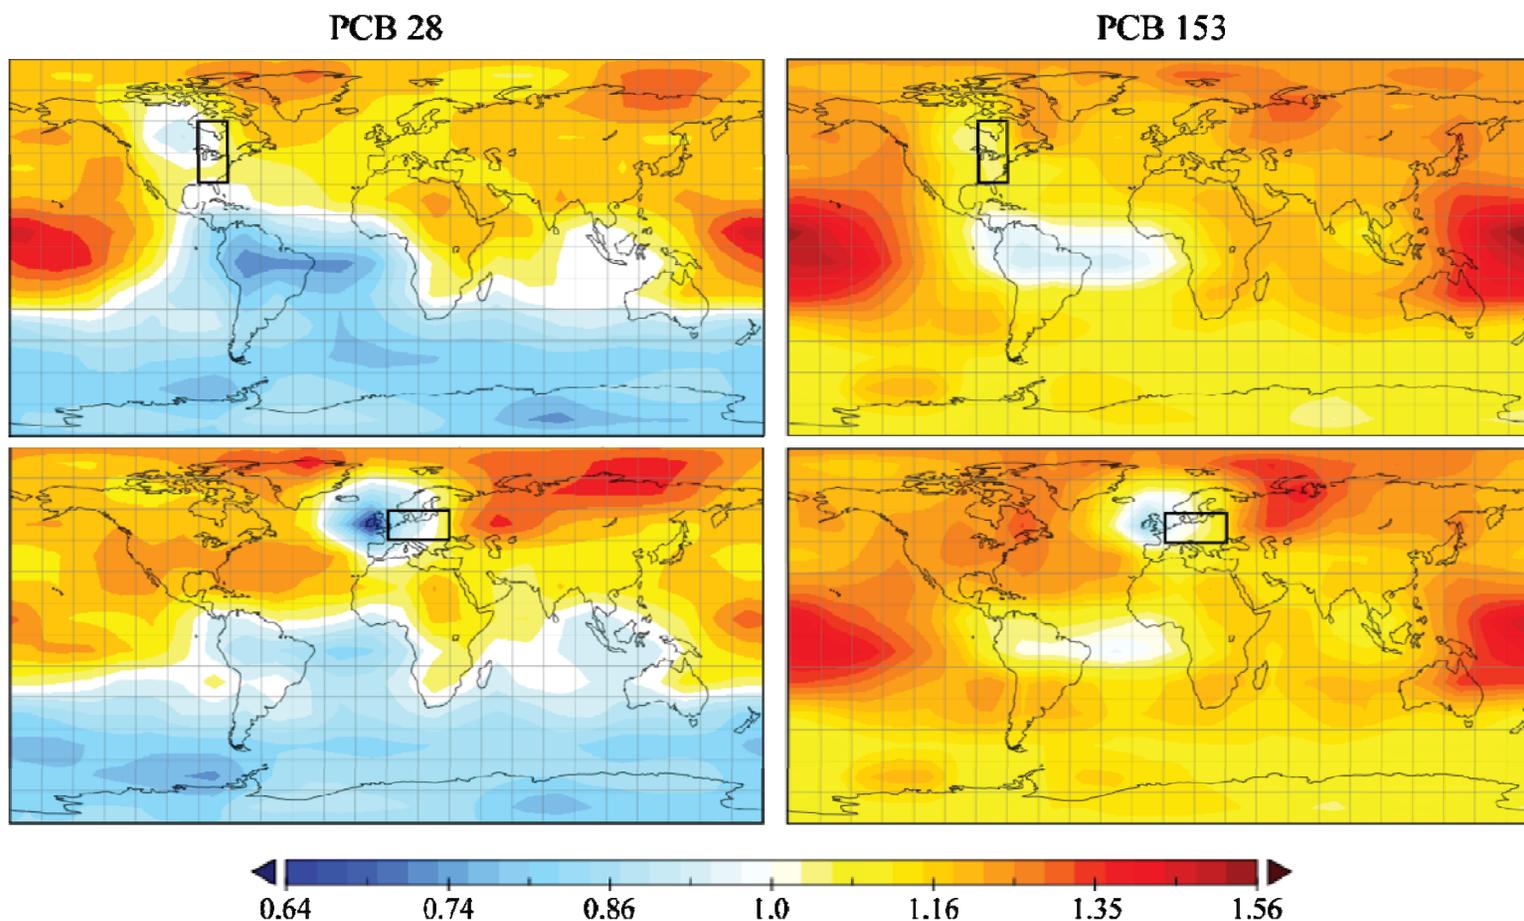

- Compare model results using a contemporary 20th century climate versus the IPCC A2 future scenario
- Climate data from ECHAM5 for:
 - Temperature
 - Atmospheric circulation
 - Ocean circulation
 - Precipitation

Effects of temperature dominate differences in dynamics of PCBs in the climate change scenario

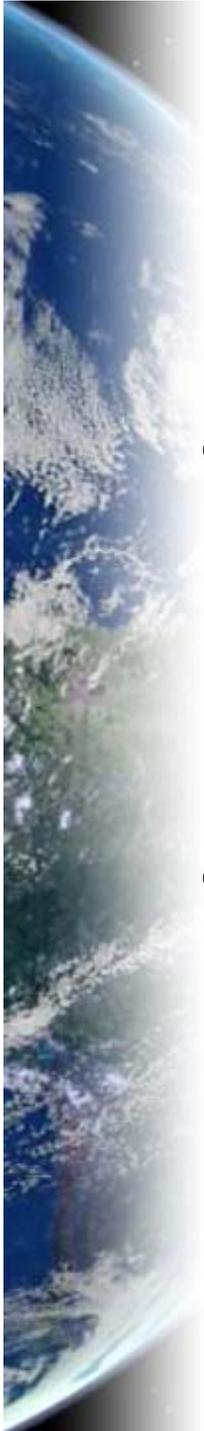

Ratio of modeled concentrations in air in the A2 scenario vs. the 20th century climate scenario

Modeled transport of PCBs to the Arctic is more efficient in the climate change scenario

Ratio of modeled concentrations in air in the A2 scenario vs. the 20th century climate scenario

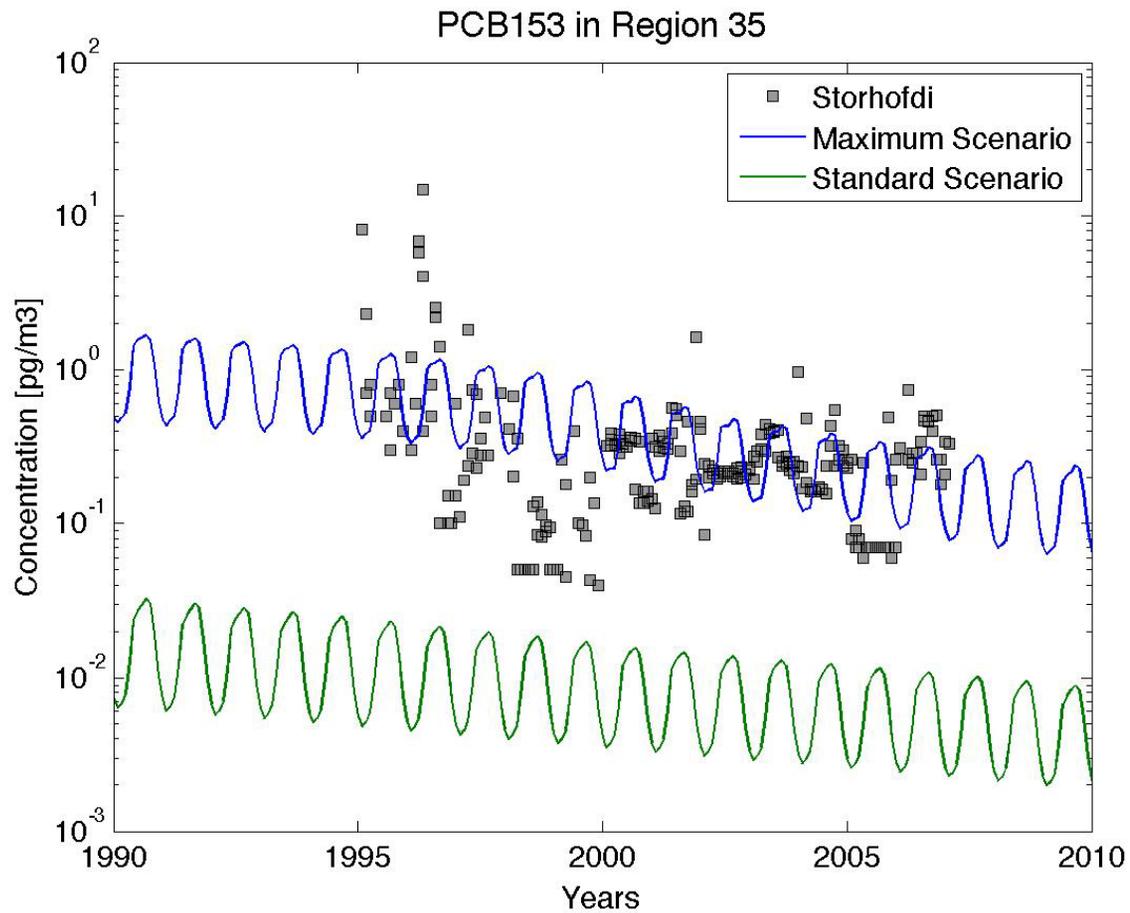

Lamon et al. *Environmental Science & Technology*, (submitted).

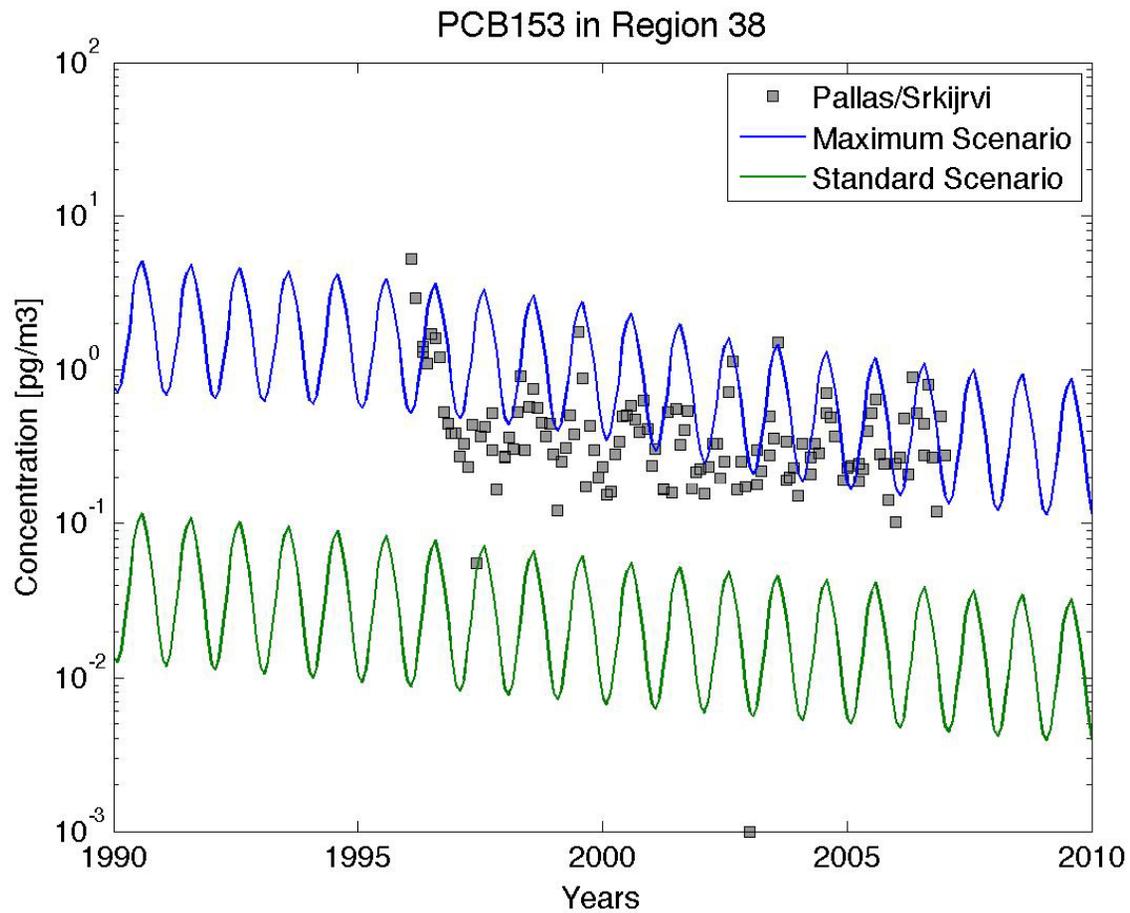

Climate change will make semi-volatile contaminants more problematic

- Increasing primary emissions by volatilization is the single most influential effect of the climate change scenario on the global dynamics of PCBs
- Increased wind speeds in the climate change scenario drive more efficient long-range transport of PCBs to remote locations
